

Computational proto-object detection in 3D data

Motivation

- ◆ Object Discovery: find objects without pre-knowledge.
- ◆ Individuate objects before their category is known (Pylyshyn 2001) [4]
- ◆ Approach:
 - ◆ observe a 3D scene over time
 - ◆ guide and bound processing by visual attention and segment attended regions
 - ◆ store and update object information incrementally in a 3D map
 - ◆ read more in [5]

System Architecture

From Saliency to Object Candidates

Generate proto-objects:

Pre-attentive (parallel) stage:

1. compute the saliency map [1]
2. threshold the saliency map
3. find connected components (**proto-objects**)
4. rank them by average saliency
5. inhibit already attended regions

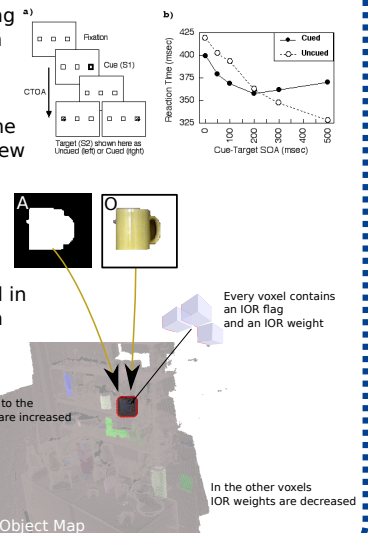

Attentive stage:

6. Pick one salient blob & fit a rectangle around it
7. Refine shape of blob with GrabCut segmentation

Inhibition of Return (IOR)

- ◆ Suppression of processing locations that have been recently the focus of attention [3]
- ◆ Enables exploration of the scene and focusing on new objects
- ◆ It is both object- and environment-based [2]
- ◆ IOR information is stored in spatial 3D coordinates in our system

Evaluation

| Object | Precision | Recall |
|--------|-----------|--------|
| Note | 69 | 43 |
| Y. cup | 90 | 40 |
| W. cup | 93 | 40 |
| Box | 99 | 30 |
| Paper | 99 | 40 |
| Sugar | 62 | 61 |
| Cup | 90 | 36 |
| Water | 99 | 37 |
| Milk | 98 | 39 |

Final 3D Segmentation results

Partial 2D segmentations
